

Testing strategies for Answerbox Handler

Ultimately it is up to you what method of testing you choose to use (automatic or manual) but I would suggest manual testing for all handlers. Document all of the tests you complete in a test report which can be found on the google drive.

This document isn't exhaustive of every test you should be completing, it just outlines some ideas, feel free (it is probably necessary) to add more tests of your choice.

- Check that the answerbox is drawn in the correct position with respect to the defined start points
- Check that the end point of the answerbox is correct with respect to the defined end points
- Check that the user cannot exceed the defined character limit
- Check that marks can be associated with the answerbox
- Check to see if all correct answers (you will need to use ~) obtain the marks
- Check to see if the retry function is working as required
